                                                                                                                                                                     HEPARIN.

HEPARINE PRODUCTS: THREE FORMS (VEGF-1, VEGF-2 AND VEGF-3) ARE CANE GENE. THE PRODUCED AS A RESULT OF ALTERNATIVE SPLICING OF THE SAME GENE. THE LONGEST FORM (VEGF-3, SHOWN HERE) CONTAINS A BASIC INSERT LINKED TO CELL-ASSCCIATION/HEPARIN-BINDING.

HOLD SPECIFICITY: IN DEVELOPING EMBRYOS, EXPRESSED MAINLY IN THE CHOROID PLEXUS, PARAVENTRICULAR NEUROSPITHELIUM, PLACENYA AND KIDNEY GLOMERULI. ALSO FOUND IN BRONCHIAL EPITHELIUM, ADRENAL GLAND AND IN SEMINIFEROUS TUBULES OF TESTIS. HIGH EXPRESSION OF VEGF CONTINUES IN KIDNEY GLOMERULI AND CHOROID PLEXUS IN ADULTS.

FINILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS.

-!- FUNCTION: THE 2-OXOGLUTARATE DEHYDROGENASE COMPLEX CATALYZES THE OVERALL CONVERSION OF 2-OXOGLUTARATE TO SUCCINYL-COA & CO(2), IT CONTAINS MULTIPLE COPIES OF 3 ENZYMATIC COMPONENTS: 2-OXOGLUTARATE DEHYDROGENASE (E1), DIHYDROLIPOAMIDE SUCCINYLTRANSFERASE (E2) & LIPOAMIDE DEHYDROGENASE (E3).
-!- CATALYTIC ACTIVITY: SUCCINYL-COA + DIHYDROLIPOAMIDE = COA + S-SUCCINYLDIHYDROLIPOAMIDE
-!- COFACTOR: THE E2 COMPONENT CONTAINS ONE COVALENTLY-BOUND LIPOYL COFACTOR:

THE LONGER FORM CONTAINS A BASIC INSERT WHICH ACTS AS A CEI RETENTION SIGNAL.

TISSUE SPECIFICITY: ABUNDANTLY AND EQUALLY EXPRESSED IN HEART AND LIVER. IN KIDNEY GLOMERULI, BRAIN AND YOLK SAC, VEGF-166 FORM IS 5- TO 10- TIMES MORE ABUNDANT THAN THE VEGF-190 FORM.

DEVELOPMENTAL STAGE: THE VEGF-166 FORM IS EXPRESSED EARLY AT DAY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AND IS UPGRADED DURING GASTRULATION. EXPRESSION OF THE VEGF-190 FORM IS DETECTABLE ONLY FROM DAY 2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: BIDDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ IS THOUGHT TO MEDIATE THE ATTACHMENT, MIGRATION, & ORGANIZATION OF CELLS INTO TISSUES DURING EMBRYONIC DEVELOPMENT BY INTERACTING WITH OTHER EXTRACELLULAR MATRIX COMPONENTS.

-! SUBUNIT: LAMININ IS A COMPERX GLYCOPROTEIN, CONSISTING OF THREE DIFFERENT POLYPEPTIDE CHAINS (ALPHA, BETA, GAMMA), WHICH ARE BOUND TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED MOLECULE COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END. THE BETA-1 CHAIN IS A SUBUNIT OF LAMINININ'.

-! SUBCELLULAR LOCATION: EXTRACELLULAR.

-! SUBCELLULAR LOCATION: EXTRACELLULAR.

-! SUBCELLULAR LOCATION: EXTRACELLULAR.

-! SUBCELLULAR LAMININ OWAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS TO FORM A COILED COIL STRUCTURE.

-! DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS TO FORM A COILED COIL STRUCTURE.

-! SIMILARITY: CONTAINS 1 LAMININ N-TERMINAL DOMAIN VI).

-! SIMILARITY: CONTAINS 1 LAMININ BGF-LIKE DOMAINS.

-! SIMILARITY: CONTAINS 1 LAMININ DOMAIN IV.
                                                                                                                                                                                                                                                                                                                                                                                                                     use by non-profit institutions as lone modified and this statement is not remove entitles requires a license agreement (so or send an email to license@isb-sib.ch).

J. BIOChém. 246:727-735(1997).

EXI. J. BIOChém. 246:727-735(1997).

- IF TWOCTION: BINDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ IS THOUGHT TO MEDIATE THE ATTACHMENT, MIGRATION, & ORGANIZATION OF CELLS INTO TISSUES DURING EMBRYONIC DEVELOPMENT BY INTERACTING WITH OTHER EXTRACELLULAR MATRIX COMPONENTS.

- ISUBUNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF TRREE BUFFERENT POLYPEPTIDE CHAINS (ALPHA, BETA, GAMMA), WHICH ARE BOUND TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED MOLECULE COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END. THE BETA-1 CHAIN IS A SUBUNIT OF LAMININ-1 (EHS LAMININ), LAMININ-1 (MEROSIN), AND LAMININ-6 (K-LAMININ).

- INSUE SPECIFICITY: FOUND IN THE BASEMENT MEMBRANES (MAJOR COMPONENT).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        EMBO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: GROWTH FACTOR FOR ENDOTHELIAL CELLS. BINDS HEPARIN. SUBUNIT: HONDIMER, DISULFIDE-LINKED. CAN ALSO FORM HETERODIM WITH VEGE.
SUBCELLULAR LOCATION: SECRETED BUT REMAINS ASSOCIATED TO CELLS TO THE EXTRACELLULAR MATRIX UNLESS RELEASED BY HEPARIN.
TISSUE SPECIFICITY: EXPRESSED IN ALL TISSUES EXCEPT LIVER.
HIGHEST LEVELS FOUND IN HEART, SKELETAL MUSCLE AND PANCREAS.
SIMILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ween the Swiss Institute of Bioinformat. Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being pri
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                             Score

A: Title: Differentiation specific element binding protein (DSEB) binds to a defined element differentiation of 3T3-L1 adipoblasts to adipocytes.

A: Reference number: A56284; MUID:95388065

A; Accession: A56284

A: Status: preliminary; not compared with conceptual translation

A; Molecule type: mRNA

A; Molecule type: mRNA

A; Residues: 1-1130 <MCG>
